

Amendment to the Specification

Please amend the paragraph beginning on line 3 of page 10 as follows:

During stress, when C1 clock 160 is high (1), C2 clock 165 is low (0), VDD1 is high, VDD2 is low, all L1 latches 145 are powered and all L2 latches 150 are dc-powered. Data in logic circuits 155B is latched by L1 latches 145. Data in logic circuits 155A cannot be latched by L2 latches 150 since all the L2 latches are dc-powered. Only L1 latches 145 and logic circuits 155A are drawing current when C1 clock 160 is high.
